SAMPLE PDF FOR TEXT EXTRACTION

10 pages of selectable text for Python practice

Purpose of This Document

This PDF was created for learners who want to practise extracting text from PDF files with Python. The document contains normal paragraphs, section headings, lists, and tables. The text is selectable, so a text extraction library can read it without using optical character recognition (OCR).

What You Can Practise

1. Open a PDF file with a Python library.
2. Read each page one at a time.
3. Extract text from each page.
4. Print the page text in the terminal.
5. Search for a word or phrase in the extracted content.
6. Save the extracted text to a TXT file.

Suggested Python Libraries

PyMuPDF is commonly imported as **pymupdf**. **pypdf** provides a simple interface for reading pages. For this first exercise, use either library and compare the output.

Document Information

Property	Value
Document name	sample_text_extraction_10_pages.pdf
Number of pages	10
Content type	Selectable digital text
Main purpose	Learning PDF text extraction
Difficulty	Beginner

PAGE 2 - STUDENT INFORMATION

Student Registration List

The following fictional student records are used to practise extracting table content. Each student has an ID, a name, a course, and a current status. The information is made up for this sample document.

Student ID	First Name	Last Name	Course	Status
ST001	Amal	Perera	Python Basics	Completed
ST002	Nimali	Silva	Data Analysis	In Progress
ST003	Kavindu	Fernando	PDF Processing	Completed
ST004	Tharushi	Jayasinghe	Web Development	Registered
ST005	Dilan	Wickramasinghe	Database Basics	In Progress
ST006	Piumi	Karunaratne	Software Testing	Completed
ST007	Ruwan	Senanayake	Cloud Fundamentals	Registered

Notes About the Records

There are seven students in the sample table. Three students have completed their courses, three are still registered or studying, and one record shows a course in progress. These records can be searched after extracting the text.

Practice Questions

1. Find the student whose ID is ST003.
2. Search for every occurrence of the word Completed.
3. Print only the line that contains Piumi Karunaratne.
4. Count how many times the word Python appears in the whole PDF.

Community Learning Library

The community learning library keeps a small catalogue of books about computing, problem solving, and personal development. The library team uses book codes to identify records and track availability.

Book Code	Book Title	Category	Year	Availability
BK101	Learning Python	Programming	2023	Available
BK102	Introduction to Databases	Databases	2022	On Loan
BK103	Computer Networks Made Simple	Networking	2021	Available
BK104	Practical Software Testing	Quality Assurance	2024	Available
BK105	Understanding Algorithms	Computer Science	2020	On Loan
BK106	A Guide to Data Analysis	Data	2024	Available

Library Process

When a new book arrives, a librarian records its code, title, category, and publication year. The availability status changes when a member borrows or returns a book. A simple program could extract catalogue information from a PDF report and place it into a searchable file.

Keywords for Searching

Try searching for: BK104, Available, Algorithms, Data Analysis, and On Loan. Notice that a word may appear in several different rows or paragraphs.

Sample Sales Report for September

This page contains fictional sales data for a small technology shop. The figures are only examples and do not represent a real business. Values are shown in Sri Lankan rupees (LKR).

Item Code	Product	Units Sold	Unit Price (LKR)	Total (LKR)
IT201	USB Keyboard	12	2,500	30,000
IT202	Wireless Mouse	18	1,800	32,400
IT203	Headset	9	4,500	40,500
IT204	Laptop Stand	7	3,200	22,400
IT205	USB Drive 64 GB	15	2,000	30,000

Summary

The sample shop sold 61 units across five products. The highest total sales value in this table came from headsets, with a value of LKR 40,500. The product with the highest number of units sold was the wireless mouse, with 18 units.

Example Report Sentence

The sales team will review monthly totals, compare them with previous months, and identify products that may need additional stock. Extracted text can be used as a first step before the data is cleaned and analysed.

Campus Garden Observation

A group of students observed the campus garden during one week in October. Their goal was to record the condition of the garden and suggest simple ways to improve it. This fictional report provides paragraphs and observations for text extraction practice.

Observation 1: Water Use

The garden is watered in the morning on most days. Students noticed that water sometimes collects near the entrance after heavy watering. The team recommends checking the hose connection and watering plants only when the soil needs it.

Observation 2: Waste Collection

Paper cups and snack wrappers were found near two benches. The team recommends placing clearly labelled bins in visible locations and reminding students to separate recyclable materials from general waste.

Observation 3: Plant Health

Most plants appeared healthy, but several small plants near the wall had dry leaves. The garden club will check the amount of sunlight in that area and review the watering schedule.

Date	Weather	Garden Condition	Action Suggested
06 Oct	Sunny	Dry soil	Check watering
07 Oct	Rainy	Wet pathway	Inspect drainage
08 Oct	Cloudy	Healthy plants	Remove weeds
09 Oct	Sunny	Litter near benches	Check bins
10 Oct	Windy	Some dry leaves	Inspect plant area

Help Desk Weekly Ticket Log

The IT help desk records technical issues reported by staff and students. Each ticket receives a reference number so the team can follow progress and communicate updates.

Ticket	Issue	Priority	Assigned Team	Status
HD-301	Password reset	Low	Service Desk	Closed
HD-302	Wi-Fi connection issue	Medium	Network Team	In Progress
HD-303	Printer not responding	Medium	Hardware Team	Closed
HD-304	Application login error	High	Application Team	Investigating
HD-305	Request for software access	Low	Service Desk	Open
HD-306	Slow internet connection	High	Network Team	In Progress

Ticket Handling Guidelines

The support team first confirms the issue and its impact. A high-priority ticket that prevents many users from working should be investigated quickly. The team records any troubleshooting steps, communicates the outcome, and closes the ticket after confirming that the issue is resolved.

Text Search Exercise

Search for the ticket HD-304. Then locate the words High, Closed, and Network Team. Finally, count the tickets that are not marked Closed.

PAGE 7 - MEETING MINUTES

Student Project Team Meeting

Date: 12 October 2026
Time: 10:00 AM to 10:45 AM
Location: Computing Laboratory 2
Meeting lead: Project Coordinator
Attendees: Amal, Nimali, Kavindu, Tharushi, and Dilan

Agenda

1. Review the current project progress.
2. Discuss blockers and risks.
3. Assign tasks for the next week.
4. Confirm the next meeting date.

Discussion Summary

The team has completed the first draft of the student registration screen. The database connection is working in the development environment, but validation messages still need improvement. The team agreed to test the application with sample records before showing it to the lecturer.

Decisions

The registration form will show a message when a required field is empty. The team will keep a shared list of defects and update each defect after testing. The project coordinator will review the task list before the next meeting.

Action	Owner	Due Date	Status
Improve form validation	Nimali	15 Oct 2026	In Progress
Test database records	Kavindu	16 Oct 2026	Open
Update defect list	Tharushi	16 Oct 2026	Open
Review project screens	Amal	17 Oct 2026	Open

PAGE 8 - PROJECT TASK TRACKER

Document Text Extraction Project

The project demonstrates a simple workflow for reading a PDF, extracting text, and saving the result. The first version uses a local PDF file. A later version may allow users to upload files through a web interface.

Task ID	Task Description	Priority	Estimated Hours	Status
PT-01	Install a PDF library	High	1	Completed
PT-02	Open the sample PDF	High	1	Completed
PT-03	Extract text page by page	High	2	In Progress
PT-04	Save output to a TXT file	Medium	1	Open
PT-05	Search for keywords	Medium	2	Open
PT-06	Handle missing files	Medium	2	Open
PT-07	Test with another PDF	Low	2	Open

Basic Error Handling

A program should show a helpful message when the PDF file cannot be found. It should also handle an empty document and pages that contain no extractable text. The program must not assume that every PDF contains the same number of pages.

Example Output Filename

extracted_text.txt

Expected Result

The output file should contain the text from all readable pages in order. It is helpful to insert a page label before each page's text, such as --- Page 1 --- and --- Page 2 --- so the output can be checked easily.

Training Course Feedback

A small fictional survey asked learners to rate a short introductory Python course. The scale ranges from 1, meaning very dissatisfied, to 5, meaning very satisfied.

Response ID	Lessons Clear	Examples Useful	Pace Suitable	Overall Rating
R001	5	5	4	5
R002	4	5	3	4
R003	4	4	4	4
R004	3	4	3	3
R005	5	5	5	5
R006	4	3	4	4

General Findings

Most respondents rated the course positively. Learners appreciated practical examples and short code demonstrations. A few respondents felt that some lessons moved too quickly, so the instructor may add a short review exercise at the end of each topic.

Suggested Improvements

The course team should provide a sample file before each exercise, demonstrate one complete example, and allow time for learners to try the task independently. A follow-up survey can check whether these changes improve the learning experience.

Important Note

The numbers on this page are fictional training examples. They should not be used as evidence about any real course or group of learners.

Your Extraction Challenge

Use this 10-page PDF to practise extracting text with Python. Start by printing every page. After that, try saving the text into a file and finding specific keywords.

Task A: Extract All Pages

Open the PDF using PyMuPDF or pypdf. Loop through its pages and print the extracted text. Make sure the output includes content from the beginning and the end of the document.

Task B: Save the Text

Write the extracted text to a file named extracted_text.txt. Include a page heading before the text from each page. Open the TXT file afterwards and confirm that it contains ten page sections.

Task C: Search for Keywords

Search for these phrases: Student Information, Wireless Mouse, Network Team, Meeting Minutes, and Overall Rating. Print the phrase when it is found and show which page contains it.

Task D: Count Words

Split the extracted text into words and print the total number of words. Remember that punctuation may be attached to words. This simple count is suitable for practice, but it is not a complete language analysis.

Mini Glossary

Term	Simple Meaning
PDF	A file format used to share documents while preserving layout.
Library	Reusable code that helps a program perform a task.
Page	One section of a PDF document.
Extract	To take information out of a file.
OCR	Technology that recognises text inside images.
Plain text	Text without complex formatting, often saved as a TXT file.

End of Document

You now have a ten-page sample PDF with searchable text, paragraphs, headings, lists, and tables. Use it to test your Python extraction code.
